

Airconditioner FJ Van sizing recommendation

A BREATH OF FRESH AIR

Next generation inverter technology

Quiet and smooth operation

High energy efficiency

Ambient LED

Light weight and compact design

Ideal for off grid adventures

Wifi/Bluetooth connectivity

Inbuilt air purifier

Have you got keys to one of these?

RV Type Optimisation

Introducing the new Freshjet 7 Series

Lite

Pro

Plus

The above are the Dometic recommendations for the Freshjet range relative to RV size; It is important to note that this range are all inverter equipped so adjust compressor speed to suit the conditions. So, if the airconditioner is smaller in a bigger RV, it will adjust the speed **upwards** to meet the conditions so will run at a higher speed and therefore current draw to achieve the desired result. (If it can) With an airconditioner that is bigger than needed for the RV, it will adjust the compressor running speed **downwards** and only consume what it needs to meet the desired result. (And it can)

Older style “on and off” cycling airconditioners, if you had one that was too big for the installation, you would see “short cycling” meaning lots of on and off clunking compressor noise and poor performance.

It is hard to get it wrong with these units which are very efficient, but ensure you take into account things such as campers with canvas sides. Better to go bigger if you can as you are trying to air condition a tent with little insulative qualities in effect.

Also consider the size and number of windows in any vehicle as heat ingress to the RV also has an effect, as does less than adequate insulation in the RV walls.
